

edit control

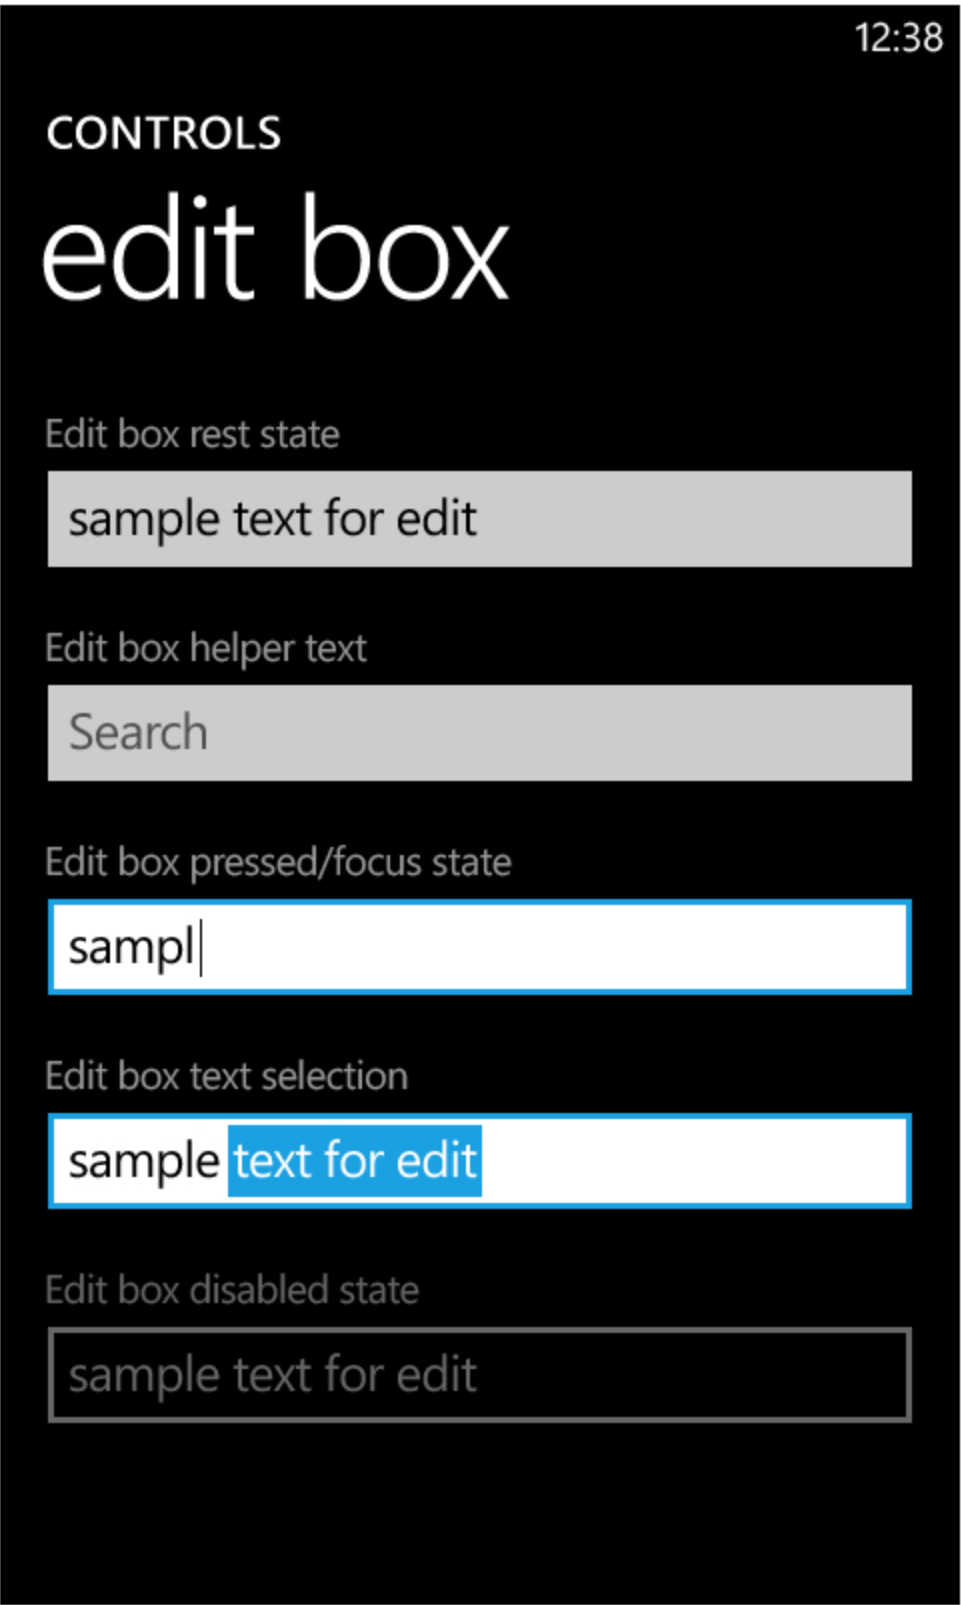

An edit control accepts user input. When an edit control is activated, the caret is shown and the on-screen keyboard is deployed. The edit control becomes active upon user tap or activation by the application. Applications should avoid activating the edit control by default when a user navigates to the page. Exceptions are allowed, such as a phone number field activated when user navigates from another page that prompted user to update their phone number.

Use a label above the edit control when the user needs to disambiguate between multiple edit controls.

Use placeholder text when instructional text is useful and there is no need for disambiguation that requires labels.

MULTI-LINE EDIT BOX WITH LABELS
Can be a fixed size or grow dynamically
