

slider

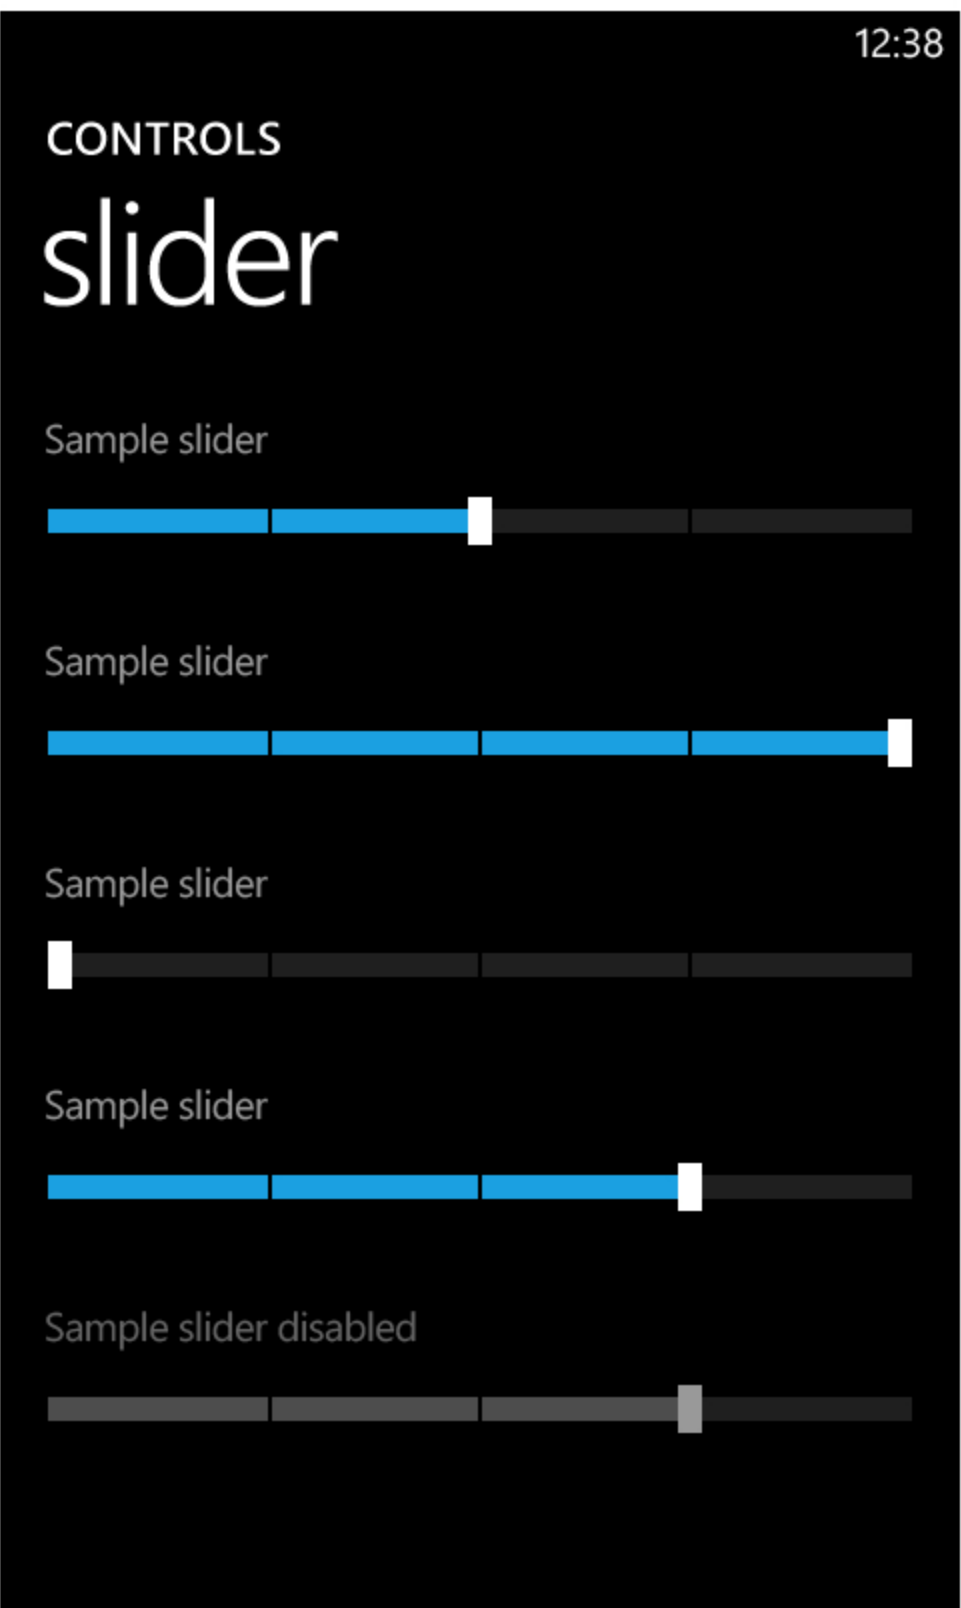

Sliders are used for setting a value in a continuous range of data (e.g. volume or brightness). Sliders are not used for discrete choices, such as days of the week, letters in the alphabet, or profiles.

Characteristics of the slider control

- Applications can use either a horizontal or vertical slider, but horizontal use is recommended.
- Only the extremes of a range are described in the labels of a slider, for example, low/high, dark/light.
- Icons can be used in sliders.
- On a single page with stacked sliders, keep the elements the same, text labels and icon labels cannot be combined.
- Tick marks are optional.
- The setting can be represented by the thumb mark, or by a colored bar.
