# Vietnam

The statistics presented here are generated by Microsoft security programs and services running on computers in Vietnam in March 2017 and previous quarters. This data is provided from administrators or users who choose to opt in to provide data to Microsoft, using IP address geolocation to determine country or region.

### **Encounter rate trends**

In March 2017, 21.2 percent of computers in Vietnam encountered malware, compared to the March 2017 worldwide encounter rate of 7.8 percent. The following figure shows the encounter and infection rate trends for Vietnam over the last three months, compared to the world as a whole.

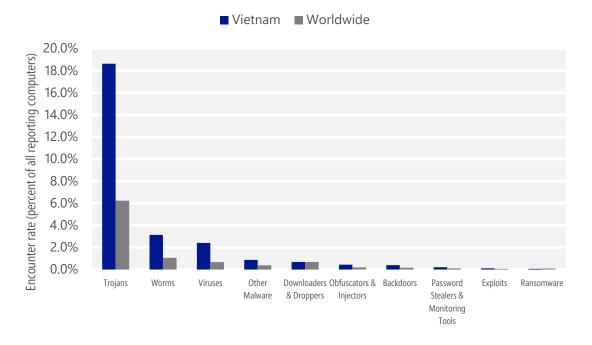

Malware encounter rate trends in Vietnam and worldwide

See the full report at http://www.microsoft.com/sir for more information about threats in Vietnam and around the world, and for explanations of the methods and terms used here.

#### **Malicious software categories**

Malicious software encountered in Vietnam in March 2017, by category

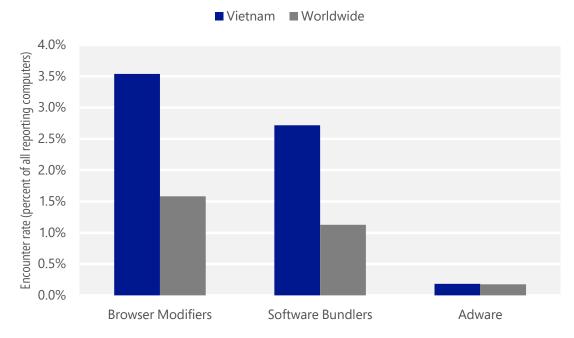

• The most common malicious software category in Vietnam in March 2017 was Trojans. It was encountered by 18.63 percent of all computers there, up from 17.66 percent in February 2017.

- The second most common malicious software category in Vietnam in March 2017 was Worms. It was encountered by 3.14 percent of all computers there, up from 2.44 percent in February 2017.
- The third most common malicious software category in Vietnam in March 2017 was Viruses, which was encountered by 2.42 percent of all computers there, up from 2.03 percent in February 2017.

#### **Unwanted software categories**

Unwanted software encountered in Vietnam in March 2017, by category

• The most common unwanted software category in Vietnam in March 2017 was Browser Modifiers. It was encountered by 3.54 percent of all computers there, down from 4.61 percent in February 2017.

- The second most common unwanted software category in Vietnam in March 2017 was Software Bundlers. It was encountered by 2.72 percent of all computers there, down from 4.13 percent in February 2017.
- The third most common unwanted software category in Vietnam in March 2017 was Adware, which was encountered by 0.18 percent of all computers there, down from 0.31 percent in February 2017.

## Top malicious software families by encounter rate

The most common malicious software families encountered in Vietnam in March 2017

	Family	Most significant category	% of reporting computers
1	Win32/Spursint	Trojans	2.65%
2	Win32/Vigorf	Trojans	2.28%
3	Win32/Fuery	Trojans	2.23%
4	Win32/Skeeyah	Trojans	1.90%
5	Win32/Dynamer	Trojans	1.29%
6	Win32/Zelrune	Trojans	1.27%
7	Win32/Swrort	Trojans	1.07%
8	Win32/Ramnit	Viruses	0.83%
9	Win32/Sality	Viruses	0.76%
10	Win32/Gamarue	Worms	0.68%

- The most common malicious software family encountered in Vietnam in March 2017 was Win32/Spursint, which was encountered by 2.65 percent of reporting computers there. Win32/Spursint is a cloud-based detection for files that have been automatically identified as malicious by the cloud-based protection feature of Windows Defender.
- The second most common malicious software family encountered in Vietnam in March 2017 was Win32/Vigorf, which was encountered by 2.28 percent of reporting computers there. Win32/Vigorf is a generic detection for a variety of threats.
- The third most common malicious software family encountered in Vietnam in March 2017 was Win32/Fuery, which was encountered by 2.23 percent of reporting computers there. Win32/Fuery is a cloud-based detection for files that have been automatically identified as malicious by the cloud-based protection feature of Windows Defender.
- The fourth most common malicious software family encountered in Vietnam in March 2017 was Win32/Skeeyah, which was encountered by 1.90 percent of reporting computers there. Win32/Skeeyah is a generic detection for various threats that display trojan characteristics.

#### Top unwanted software families by encounter rate

The most common unwanted software families encountered in Vietnam in March 2017

	Family	Most significant category	% of reporting computers
1	Win32/Sasquor	Browser Modifiers	0.66%
2	Win32/Prepscram	Software Bundlers	0.60%
3	Win32/ICLoader	Software Bundlers	0.51%
4	Win32/Foxiebro	Browser Modifiers	0.50%
5	Win32/Heazycrome	Browser Modifiers	0.42%

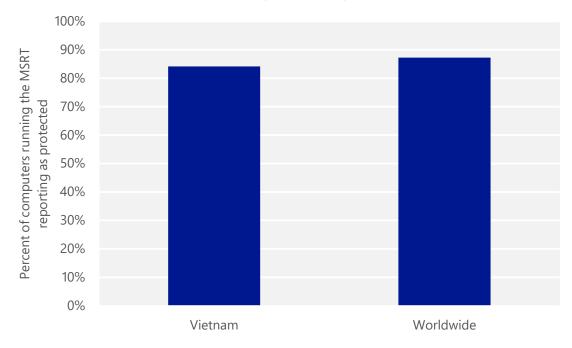

- The most common unwanted software family encountered in Vietnam in March 2017 was Win32/Sasquor, which was encountered by 0.66 percent of reporting computers there. Win32/Sasquor is a browser modifier that modifies search and home page settings, and installs services and scheduled tasks to prevent the user from changing them back. It can also download additional malware, including Win32/SupTab and Win32/Xadupi.
- The second most common unwanted software family encountered in Vietnam in March 2017 was Win32/Prepscram, which was encountered by 0.60 percent of reporting computers there. Win32/Prepscram is a software bundler that installs unwanted software alongside the desired applications. It has been observed installing browser modifiers such as Win32/Sasquor, Win32/Soctuseer, and Win32/Flowsurf.
- The third most common unwanted software family encountered in Vietnam in March 2017 was Win32/ICLoader, which was encountered by 0.51 percent of reporting computers there. Win32/ICLoader is a software bundler distributed from software crack sites, which installs unwanted software alongside the desired program. It sometimes installs other unwanted software, such as Win32/Neobar.

#### Security software use

Recent releases of the MSRT collect and report details about the state of realtime antimalware software on a computer, if the computer's administrator has chosen to opt in to provide data to Microsoft. This telemetry data makes it possible to analyze security software usage patterns around the world and correlate them with infection rates.

The figure below shows the percentage of computers worldwide and in Vietnam that the MSRT found to be running up-to-date real-time security software in March 2017.

Percent of computers in Vietnam and worldwide protected by real-time security software in March 2017

#### **Malicious websites**

Attackers often use websites to conduct phishing attacks or distribute malware. Malicious websites typically appear completely legitimate and often provide no outward indicators of their malicious nature, even to experienced computer users. In many cases, these sites are legitimate websites that have been compromised by malware, SQL injection, or other techniques, in an effort by attackers to take advantage of the trust users have invested in them. To help protect users from malicious webpages, Microsoft and other browser vendors have developed filters that keep track of sites that host malware and phishing attacks and display prominent warnings when users try to navigate to them.

The information presented in this section has been generated from telemetry data produced by Windows Defender SmartScreen in Microsoft Edge and Internet Explorer. See the Malicious Websites section of *Microsoft Security Intelligence Report, Volume 22* for more information about these protections and how the data is collected.
